## Robotics for crop care.

Every robot is custom-made. For crops on tables, on substrate or in the soil. For high or low greenhouses. We make long-life spraying and watering robots that give good results, with various options and vision techniques.

## Shuttles and transportation equipment.

Moving the spray robot or working platform can be done in many ways, via the walkway, via the pipe rail. From manual to fully automatic. There is a solution for every situation.

## Inspection and working platforms.

For safe inspection of screen and lighting systems, we provide custom-made systems high in the greenhouse or for above the crop. With a crop platform, the crop can be cared for, inspected for diseases and the condition of the plant can be checked.
